Class Lectures (for Chapter 7)

## What's coming?

Deeper aspects of measure theory.

## What's coming?

Deeper aspects of measure theory.
The main theorems of this chapter are the Radon-Nikodym Theorem and the Lebesgue Decomposition Theorem.

## What's coming?

Deeper aspects of measure theory.
The main theorems of this chapter are the Radon-Nikodym Theorem and the Lebesgue Decomposition Theorem.

We will need a lot of preliminary work, including the so-called Hahn and Jordan Decomposition theorems.

## Signed measures

## Definition

If $(X, \mathcal{M})$ is a measurable space, a signed measure is a $\operatorname{map} \nu$ from $\mathcal{M}$ to $[-\infty, \infty]$ satisfying

## Signed measures

## Definition

If $(X, \mathcal{M})$ is a measurable space, a signed measure is a $\operatorname{map} \nu$ from $\mathcal{M}$ to $[-\infty, \infty]$ satisfying
(i) $\nu(\emptyset)=0$.

## Signed measures

## Definition

If $(X, \mathcal{M})$ is a measurable space, a signed measure is a map $\nu$ from $\mathcal{M}$ to $[-\infty, \infty]$ satisfying
(i) $\nu(\emptyset)=0$.
(ii) At most one of the values $\pm \infty$ are assumed.

## Signed measures

## Definition

If $(X, \mathcal{M})$ is a measurable space, a signed measure is a $\operatorname{map} \nu$ from $\mathcal{M}$ to $[-\infty, \infty]$ satisfying
(i) $\nu(\emptyset)=0$.
(ii) At most one of the values $\pm \infty$ are assumed.
(iii) If $A_{1}, A_{2}, \ldots$, are (pairwise) disjoint elements of $\mathcal{M}$, then

$$
\nu\left(\bigcup_{i} A_{i}\right)=\sum_{i} \nu\left(A_{i}\right)
$$

## Signed measures

b. If $\mu_{1}$ and $\mu_{2}$ are finite measures (or if at least one is a finite measure), then $\mu_{1}-\mu_{2}$ is a signed measure. (Prove this!).
c. Condition (ii) is there to avoid having $\infty-\infty$.

## Signed measures

First goal (Jordan Decomposition Theorem): Every signed measure has the form $\mu_{1}-\mu_{2}$ with $\mu_{1}$ and $\mu_{2}$ being measures with at least one being a finite measure

## Signed measures

First goal (Jordan Decomposition Theorem): Every signed measure has the form $\mu_{1}-\mu_{2}$ with $\mu_{1}$ and $\mu_{2}$ being measures with at least one being a finite measure and where $\mu_{1}$ and $\mu_{2}$ will "live on different parts of the space": i.e., mutually singular.

## Signed measures

First goal (Jordan Decomposition Theorem): Every signed measure has the form $\mu_{1}-\mu_{2}$ with $\mu_{1}$ and $\mu_{2}$ being measures with at least one being a finite measure and where $\mu_{1}$ and $\mu_{2}$ will "live on different parts of the space": i.e., mutually singular.

## Definition

If $\nu$ is a signed measure on $(X, \mathcal{M})$, a set $A \in \mathcal{M}$ is called a positive set if $\nu(B) \geq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$.

## Signed measures

First goal (Jordan Decomposition Theorem): Every signed measure has the form $\mu_{1}-\mu_{2}$ with $\mu_{1}$ and $\mu_{2}$ being measures with at least one being a finite measure and where $\mu_{1}$ and $\mu_{2}$ will "live on different parts of the space": i.e., mutually singular.

## Definition

If $\nu$ is a signed measure on $(X, \mathcal{M})$, a set $A \in \mathcal{M}$ is called a positive set if $\nu(B) \geq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$. $A$ is called a negative set if
$\nu(B) \leq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$.

## Signed measures

First goal (Jordan Decomposition Theorem): Every signed measure has the form $\mu_{1}-\mu_{2}$ with $\mu_{1}$ and $\mu_{2}$ being measures with at least one being a finite measure and where $\mu_{1}$ and $\mu_{2}$ will "live on different parts of the space": i.e., mutually singular.

## Definition

If $\nu$ is a signed measure on $(X, \mathcal{M})$, a set $A \in \mathcal{M}$ is called a positive set if $\nu(B) \geq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$. $A$ is called a negative set if $\nu(B) \leq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$. $A$ is called a null set if $\nu(B)=0$ for all $B \subseteq A$ with $B \in \mathcal{M}$.

## Signed measures

First goal (Jordan Decomposition Theorem): Every signed measure has the form $\mu_{1}-\mu_{2}$ with $\mu_{1}$ and $\mu_{2}$ being measures with at least one being a finite measure and where $\mu_{1}$ and $\mu_{2}$ will "live on different parts of the space": i.e., mutually singular.

## Definition

If $\nu$ is a signed measure on $(X, \mathcal{M})$, a set $A \in \mathcal{M}$ is called a positive set if $\nu(B) \geq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$. $A$ is called a negative set if
$\nu(B) \leq 0$ for all $B \subseteq A$ with $B \in \mathcal{M}$. $A$ is called a null set if $\nu(B)=0$ for all $B \subseteq A$ with $B \in \mathcal{M}$. (Note that a set is null if and only if it is both a positive and a negative set.)

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets, $\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets, $\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$. The measure of other sets is just obtained by adding up the pieces.

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets, $\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$ and that $\{2,4\}$ is a positive set and $\{1,3\}$ is a negative set.

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$ and that $\{2,4\}$ is a positive set and $\{1,3\}$ is a negative set.

Note also that if we define $\mu_{1}$ and $\mu_{2}$ by
$\mu_{1}(\{1\})=0, \mu_{1}(\{2\})=3, \mu_{1}(\{3\})=0$ and $\mu_{1}(\{4\})=1$

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$ and that $\{2,4\}$ is a positive set and $\{1,3\}$ is a negative set.

Note also that if we define $\mu_{1}$ and $\mu_{2}$ by
$\mu_{1}(\{1\})=0, \mu_{1}(\{2\})=3, \mu_{1}(\{3\})=0$ and $\mu_{1}(\{4\})=1$ and $\mu_{2}(\{1\})=2, \mu_{2}(\{2\})=0, \mu_{1}(\{3\})=1$ and $\mu_{1}(\{4\})=0$,

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$ and that $\{2,4\}$ is a positive set and $\{1,3\}$ is a negative set.

Note also that if we define $\mu_{1}$ and $\mu_{2}$ by
$\mu_{1}(\{1\})=0, \mu_{1}(\{2\})=3, \mu_{1}(\{3\})=0$ and $\mu_{1}(\{4\})=1$ and $\mu_{2}(\{1\})=2, \mu_{2}(\{2\})=0, \mu_{1}(\{3\})=1$ and $\mu_{1}(\{4\})=0$, then

$$
\mu=\mu_{1}-\mu_{2}
$$

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$ and that $\{2,4\}$ is a positive set and $\{1,3\}$ is a negative set.

Note also that if we define $\mu_{1}$ and $\mu_{2}$ by
$\mu_{1}(\{1\})=0, \mu_{1}(\{2\})=3, \mu_{1}(\{3\})=0$ and $\mu_{1}(\{4\})=1$ and $\mu_{2}(\{1\})=2, \mu_{2}(\{2\})=0, \mu_{1}(\{3\})=1$ and $\mu_{1}(\{4\})=0$, then

$$
\mu=\mu_{1}-\mu_{2}
$$

and $\mu_{1}$ and $\mu_{2}$ "live on different parts of $X^{\prime \prime}$.

## A trivial but illustrative example

Example: $X=\{1,2,3,4\}, \mathcal{M}$ is all subsets,
$\mu(\{1\})=-2, \mu(\{2\})=3, \mu(\{3\})=-1$ and $\mu(\{4\})=1$.
The measure of other sets is just obtained by adding up the pieces.
$\mu(\{2,3\})=2$ but $\{2,3\}$ is not a positive set since it contains $\{3\}$ which has negative measure.

Note $X=\{2,4\} \cup\{1,3\}$ and that $\{2,4\}$ is a positive set and $\{1,3\}$ is a negative set.

Note also that if we define $\mu_{1}$ and $\mu_{2}$ by
$\mu_{1}(\{1\})=0, \mu_{1}(\{2\})=3, \mu_{1}(\{3\})=0$ and $\mu_{1}(\{4\})=1$ and $\mu_{2}(\{1\})=2, \mu_{2}(\{2\})=0, \mu_{1}(\{3\})=1$ and $\mu_{1}(\{4\})=0$, then

$$
\mu=\mu_{1}-\mu_{2}
$$

and $\mu_{1}$ and $\mu_{2}$ "live on different parts of $X^{\prime \prime}$.
This is the picture we want in general.

## Hahn Decomposition Theorem

## Theorem

(Hahn Decomposition Theorem) If $\nu$ is a signed measure on $(X, \mathcal{M})$, then $X$ can be partitioned into two sets $P, N(P \cup N=X, P \cap N=\emptyset)$ with $P, N \in \mathcal{M}$

## Hahn Decomposition Theorem

## Theorem

(Hahn Decomposition Theorem) If $\nu$ is a signed measure on $(X, \mathcal{M})$, then $X$ can be partitioned into two sets $P, N(P \cup N=X, P \cap N=\emptyset)$ with $P, N \in \mathcal{M}$ where $P$ is a positive set and $N$ is a negative set.

## Hahn Decomposition Theorem

## Theorem

(Hahn Decomposition Theorem) If $\nu$ is a signed measure on $(X, \mathcal{M})$, then $X$ can be partitioned into two sets $P, N(P \cup N=X, P \cap N=\emptyset)$ with $P, N \in \mathcal{M}$ where $P$ is a positive set and $N$ is a negative set. There is "almost uniqueness" in that if $\left(P^{\prime}, N^{\prime}\right)$ is another such partition, then $P \triangle P^{\prime}$ and $N \triangle N^{\prime}$ are each null sets.

## Hahn Decomposition Theorem

## Theorem

(Hahn Decomposition Theorem) If $\nu$ is a signed measure on $(X, \mathcal{M})$, then $X$ can be partitioned into two sets $P, N(P \cup N=X, P \cap N=\emptyset)$ with $P, N \in \mathcal{M}$ where $P$ is a positive set and $N$ is a negative set. There is "almost uniqueness" in that if $\left(P^{\prime}, N^{\prime}\right)$ is another such partition, then $P \triangle P^{\prime}$ and $N \triangle N^{\prime}$ are each null sets.

Simple Example: Consider $\left([0,1], \mathcal{B}_{[0,1]}\right)$ and let $m$ be Lebesgue measure.

## Hahn Decomposition Theorem

## Theorem

(Hahn Decomposition Theorem) If $\nu$ is a signed measure on $(X, \mathcal{M})$, then $X$ can be partitioned into two sets $P, N(P \cup N=X, P \cap N=\emptyset)$ with $P, N \in \mathcal{M}$ where $P$ is a positive set and $N$ is a negative set. There is "almost uniqueness" in that if $\left(P^{\prime}, N^{\prime}\right)$ is another such partition, then $P \triangle P^{\prime}$ and $N \triangle N^{\prime}$ are each null sets.

Simple Example: Consider $\left([0,1], \mathcal{B}_{[0,1]}\right)$ and let $m$ be Lebesgue measure.
Let

$$
\nu(A):=m\left(A \cap\left[0, \frac{3}{4}\right]\right)-m\left(A \cap\left(\frac{3}{4}, 1\right]\right) .
$$

## Hahn Decomposition Theorem

## Theorem

(Hahn Decomposition Theorem) If $\nu$ is a signed measure on $(X, \mathcal{M})$, then $X$ can be partitioned into two sets $P, N(P \cup N=X, P \cap N=\emptyset)$ with $P, N \in \mathcal{M}$ where $P$ is a positive set and $N$ is a negative set. There is "almost uniqueness" in that if $\left(P^{\prime}, N^{\prime}\right)$ is another such partition, then $P \triangle P^{\prime}$ and $N \triangle N^{\prime}$ are each null sets.

Simple Example: Consider $\left([0,1], \mathcal{B}_{[0,1]}\right)$ and let $m$ be Lebesgue measure. Let

$$
\nu(A):=m\left(A \cap\left[0, \frac{3}{4}\right]\right)-m\left(A \cap\left(\frac{3}{4}, 1\right]\right) .
$$

Then a Hahn decomposition is given by $\left(\left[0, \frac{3}{4}\right],\left(\frac{3}{4}, 1\right]\right)$.

## Key lemma for the Hahn Decomposition Theorem

First two fairly easy fact about signed measures; these are Propositions 3.1 and Lemma 3.2 in F .

## Key lemma for the Hahn Decomposition Theorem

First two fairly easy fact about signed measures; these are Propositions 3.1 and Lemma 3.2 in F.
(i) The continuity from below and from above for measures applies to signed measures as well.

## Key lemma for the Hahn Decomposition Theorem

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$.

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure and hence $X$ is a negative set.

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure and hence $X$ is a negative set.

Otherwise, we choose a sequence of positive sets $\left(P_{j}\right)$ so that

$$
\lim _{j \rightarrow \infty} \nu\left(P_{j}\right)=m
$$

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure and hence $X$ is a negative set.

Otherwise, we choose a sequence of positive sets $\left(P_{j}\right)$ so that

$$
\lim _{j \rightarrow \infty} \nu\left(P_{j}\right)=m
$$

Letting $P=\bigcup_{j} P_{j}$, we have that $P$ is a positive set.

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure and hence $X$ is a negative set.

Otherwise, we choose a sequence of positive sets $\left(P_{j}\right)$ so that

$$
\lim _{j \rightarrow \infty} \nu\left(P_{j}\right)=m
$$

Letting $P=\bigcup_{j} P_{j}$, we have that $P$ is a positive set. Therefore, we have $\nu(P)=m$ since $\nu(P) \geq \nu\left(P_{j}\right)$ for all $j$.

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure and hence $X$ is a negative set.

Otherwise, we choose a sequence of positive sets $\left(P_{j}\right)$ so that

$$
\lim _{j \rightarrow \infty} \nu\left(P_{j}\right)=m
$$

Letting $P=\bigcup_{j} P_{j}$, we have that $P$ is a positive set. Therefore, we have $\nu(P)=m$ since $\nu(P) \geq \nu\left(P_{j}\right)$ for all $j$. This implies that $m<\infty$.

## Proof of the Hahn Decomposition Theorem

Assume WLOG $\infty$ is not obtained by $\nu$. Let

$$
m=\sup \{\nu(E): E \text { is a positive set }\} .
$$

If $m=0$, then the lemma implies that every subset has nonpositive measure and hence $X$ is a negative set.

Otherwise, we choose a sequence of positive sets $\left(P_{j}\right)$ so that

$$
\lim _{j \rightarrow \infty} \nu\left(P_{j}\right)=m
$$

Letting $P=\bigcup_{j} P_{j}$, we have that $P$ is a positive set. Therefore, we have $\nu(P)=m$ since $\nu(P) \geq \nu\left(P_{j}\right)$ for all $j$. This implies that $m<\infty$. If we can show that $P^{c}$ is a negative set, we would be done.

## Proof of the Hahn Decomposition Theorem

## Proof of the Hahn Decomposition Theorem

If $P^{c}$ is not a negative set, then there exists $E \subseteq P^{c}$ with $\nu(E)>0$.

## Proof of the Hahn Decomposition Theorem

If $P^{c}$ is not a negative set, then there exists $E \subseteq P^{c}$ with $\nu(E)>0$.
By the key lemma, $E$ contains a subset $F$ which is a positive set and with $\nu(F)>0$.

## Proof of the Hahn Decomposition Theorem

If $P^{c}$ is not a negative set, then there exists $E \subseteq P^{c}$ with $\nu(E)>0$.
By the key lemma, $E$ contains a subset $F$ which is a positive set and with $\nu(F)>0$.

Then $P \cup F$ would be a positive set

## Proof of the Hahn Decomposition Theorem

If $P^{c}$ is not a negative set, then there exists $E \subseteq P^{c}$ with $\nu(E)>0$.
By the key lemma, $E$ contains a subset $F$ which is a positive set and with $\nu(F)>0$.

Then $P \cup F$ would be a positive set with $\nu$-measure larger than $m$.

## Proof of the Hahn Decomposition Theorem

If $P^{c}$ is not a negative set, then there exists $E \subseteq P^{c}$ with $\nu(E)>0$.
By the key lemma, $E$ contains a subset $F$ which is a positive set and with $\nu(F)>0$.

Then $P \cup F$ would be a positive set with $\nu$-measure larger than $m$. Contradiction. QED

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$,

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$ so that $\mu(E)=0=\nu(F)$.

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$ so that $\mu(E)=0=\nu(F)$. So $\mu$ "lives on $F^{\prime \prime}$ and $\nu$ "lives on $E$ ".

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$ so that $\mu(E)=0=\nu(F)$. So $\mu$ "lives on $F^{\prime \prime}$ and $\nu$ "lives on $E^{\prime \prime}$. (For signed measures, the definition needs to be modified.)

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$ so that $\mu(E)=0=\nu(F)$. So $\mu$ "lives on $F^{\prime \prime}$ and $\nu$ "lives on $E^{\prime \prime}$. (For signed measures, the definition needs to be modified.)

Example: Let $X=[0,1]$ with the Borel sets.

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$ so that $\mu(E)=0=\nu(F)$. So $\mu$ "lives on $F^{\prime \prime}$ and $\nu$ "lives on $E^{\text {". (For signed }}$ measures, the definition needs to be modified.)

Example: Let $X=[0,1]$ with the Borel sets.
Let $\mu$ be Lebesgue measure restricted to $[1 / 2,1]$

## Mutual singularity

## Definition

Two measures $\mu$ and $\nu$ on $(X, \mathcal{M})$ are mutually singular, $\mu \perp \nu$, if $X$ can be partitioned into two disjoint sets $E$ and $F$ in $\mathcal{M}$ so that $\mu(E)=0=\nu(F)$. So $\mu$ "lives on $F^{\prime \prime}$ and $\nu$ "lives on $E^{\prime \prime}$. (For signed measures, the definition needs to be modified.)

Example: Let $X=[0,1]$ with the Borel sets.
Let $\mu$ be Lebesgue measure restricted to $[1 / 2,1]$ meaning $\mu(A)=m(A \cap[1 / 2,1])$.

## Mutual singularity

Is $\nu^{+}$and $\nu^{-}$just $\mu_{1}$ and $\mu_{2}$ ?
No. $\mu_{1}$ and $\mu_{2}$ are not mutually singular.
Instead one should take $\nu^{+}$to be Lebesgue measure restricted to $[0,1 / 4]$ and $\nu^{-}$to be Lebesgue measure restricted to $[3 / 4,1]$.

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.
Let $\nu^{+}$be the "restriction of $\nu$ to $P^{\prime \prime}$ ", meaning

$$
\nu^{+}(A):=\nu(A \cap P)
$$

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.
Let $\nu^{+}$be the "restriction of $\nu$ to $P^{\prime \prime}$ ", meaning

$$
\nu^{+}(A):=\nu(A \cap P)
$$

Note that $\nu^{+}$is a measure since $P$ is a positive set.

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.
Let $\nu^{+}$be the "restriction of $\nu$ to $P^{\prime \prime}$ ", meaning

$$
\nu^{+}(A):=\nu(A \cap P)
$$

Note that $\nu^{+}$is a measure since $P$ is a positive set.
Let $\nu^{-}$be the "restriction of $\nu$ to $N$ " but "reversed", meaning

$$
\nu^{-}(A):=-\nu(A \cap N)
$$

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.
Let $\nu^{+}$be the "restriction of $\nu$ to $P^{\prime \prime}$ ", meaning

$$
\nu^{+}(A):=\nu(A \cap P)
$$

Note that $\nu^{+}$is a measure since $P$ is a positive set.
Let $\nu^{-}$be the "restriction of $\nu$ to $N$ " but "reversed", meaning

$$
\nu^{-}(A):=-\nu(A \cap N) .
$$

Note that $\nu^{-}$is a measure since $N$ is a negative set.

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.
Let $\nu^{+}$be the "restriction of $\nu$ to $P^{\prime}$ ", meaning

$$
\nu^{+}(A):=\nu(A \cap P)
$$

Note that $\nu^{+}$is a measure since $P$ is a positive set.
Let $\nu^{-}$be the "restriction of $\nu$ to $N$ " but "reversed", meaning

$$
\nu^{-}(A):=-\nu(A \cap N) .
$$

Note that $\nu^{-}$is a measure since $N$ is a negative set.
$\nu^{+}(N)=0=\nu^{-}(P)$ and so $\nu^{+} \perp \nu^{-}$.

## Proof of The Jordan Decomposition Theorem

Let $P, N$ be a Hahn decomposition of $\nu$.
Let $\nu^{+}$be the "restriction of $\nu$ to $P^{\prime}$ ", meaning

$$
\nu^{+}(A):=\nu(A \cap P)
$$

Note that $\nu^{+}$is a measure since $P$ is a positive set.
Let $\nu^{-}$be the "restriction of $\nu$ to $N$ " but "reversed", meaning

$$
\nu^{-}(A):=-\nu(A \cap N) .
$$

Note that $\nu^{-}$is a measure since $N$ is a negative set.
$\nu^{+}(N)=0=\nu^{-}(P)$ and so $\nu^{+} \perp \nu^{-}$.
Also

$$
\left(\nu^{+}-\nu^{-}\right)(A)=\nu^{+}(A)-\nu^{-}(A)=\nu(A \cap P)+\nu(A \cap N)=\nu(A)
$$

\mu(A)=0 \text { implies that } \nu(A)=0 .
$$

The following is a simple but central example illustrating this concept. Consider a measure space $(X, \mathcal{M}, \mu)$ and a function $f \in L^{+}((X, \mathcal{M}, \mu))$. Define the measure $\nu$ on $(X, \mathcal{M})$ by

$$
\nu(A):=\int_{A} f(x) d \mu(x) .
$$

(Convince yourself this is a measure; uses linearity of the integral and the Monotone Convergence Theorem.) $\nu$ is called $f \mu$ and one has $\nu \ll \mu$.

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite.

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite. Then there exists a measurable function $f_{0}:(X, \mathcal{M}) \rightarrow[0, \infty)$

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite. Then there exists a measurable function $f_{0}:(X, \mathcal{M}) \rightarrow[0, \infty)$ such that for all $A \in \mathcal{M}$,

$$
\nu(A):=\int_{A} f_{0}(x) d \mu(x) .
$$

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite. Then there exists a measurable function $f_{0}:(X, \mathcal{M}) \rightarrow[0, \infty)$ such that for all $A \in \mathcal{M}$,

$$
\nu(A):=\int_{A} f_{0}(x) d \mu(x) .
$$

One can modify $f_{0}$ on a set of $\mu$-measure 0 and the above will still be true.

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite. Then there exists a measurable function $f_{0}:(X, \mathcal{M}) \rightarrow[0, \infty)$ such that for all $A \in \mathcal{M}$,

$$
\nu(A):=\int_{A} f_{0}(x) d \mu(x) .
$$

One can modify $f_{0}$ on a set of $\mu$-measure 0 and the above will still be true. However, $f_{0}$ is unique in the sense that if $g_{0}$ is another such function,

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite. Then there exists a measurable function $f_{0}:(X, \mathcal{M}) \rightarrow[0, \infty)$ such that for all $A \in \mathcal{M}$,

$$
\nu(A):=\int_{A} f_{0}(x) d \mu(x) .
$$

One can modify $f_{0}$ on a set of $\mu$-measure 0 and the above will still be true. However, $f_{0}$ is unique in the sense that if $g_{0}$ is another such function, then

$$
\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}=0 .
$$

The Radon-Nikodym Theorem (converse of the previous example)

## Theorem

Let $\nu$ and $\mu$ be two measures on $(X, \mathcal{M})$ with $\nu \ll \mu$ and with $\nu$ and $\mu$ being $\sigma$-finite. Then there exists a measurable function $f_{0}:(X, \mathcal{M}) \rightarrow[0, \infty)$ such that for all $A \in \mathcal{M}$,

$$
\nu(A):=\int_{A} f_{0}(x) d \mu(x) .
$$

One can modify $f_{0}$ on a set of $\mu$-measure 0 and the above will still be true. However, $f_{0}$ is unique in the sense that if $g_{0}$ is another such function, then

$$
\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}=0 .
$$

This is false if one does not assume $\sigma$-finiteness.

## The Radon-Nikodym Theorem

## The Radon-Nikodym Theorem

## Remarks:

1. The $f_{0}$ above is called the Radon-Nikodym Derivative of $\nu$ with respect to $\mu$.

## The Radon-Nikodym Theorem

## Remarks:

1. The $f_{0}$ above is called the Radon-Nikodym Derivative of $\nu$ with respect to $\mu$.
2. If $\mu$ is Lebesgue measure on $(R, \mathcal{B})$ and $\nu$ is the distribution (or law) of a random variable which is absolutely continuous with respect to $\mu$,

## The Radon-Nikodym Theorem

Remarks:

1. The $f_{0}$ above is called the Radon-Nikodym Derivative of $\nu$ with respect to $\mu$.
2. If $\mu$ is Lebesgue measure on $(R, \mathcal{B})$ and $\nu$ is the distribution (or law) of a random variable which is absolutely continuous with respect to $\mu$, then the Radon-Nikodym Derivative of $\nu$ with respect to $\mu$ is simply the "probability density function" from elementary probability.

## The Radon-Nikodym Theorem

Remarks:

1. The $f_{0}$ above is called the Radon-Nikodym Derivative of $\nu$ with respect to $\mu$.
2. If $\mu$ is Lebesgue measure on $(R, \mathcal{B})$ and $\nu$ is the distribution (or law) of a random variable which is absolutely continuous with respect to $\mu$, then the Radon-Nikodym Derivative of $\nu$ with respect to $\mu$ is simply the "probability density function" from elementary probability.
3. (Kolmogorov) The Radon-Nikodym Theorem is crucial in advanced probability when one deals with the subtle concept of conditioning.

Illustration of The Radon-Nikodym Theorem in a simple case

Let $X=\{1,2,3\}$ (full $\sigma$-algebra).

Illustration of The Radon-Nikodym Theorem in a simple case

Let $X=\{1,2,3\}$ (full $\sigma$-algebra).
Let $\mu=(1 / 3,0,4)$

Define

$$
\mathcal{F}:=\left\{f: X \rightarrow[0, \infty): \int_{A} f(x) d \mu(x) \leq \nu(A) \forall A \in \mathcal{M}\right\}
$$

Note $\mathcal{F}$ is nonempty since $f \equiv 0$ is in $\mathcal{F}$. Let

$$
m:=\sup \left\{\int f(x) d \mu(x): f \in \mathcal{F}\right\} .
$$

Note that $m \leq \nu(X)(<\infty)$.
claim: There exists $f_{0} \in \mathcal{F}$ for which $\int f_{0}(x) d \mu(x)=m$; i.e. the supremum above is achieved.

$$

Let $(P, N)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon \mu$.
Case 1: $\mu(P)=0$. Then, since $\nu \ll \mu$, we have that $\nu(P)=0$ and hence $\left(\nu_{0}-\epsilon \mu\right)(P)=0$, contradicting (1).

## Proof of The Radon-Nikodym Theorem for finite measure spaces

Proof of The Radon-Nikodym Theorem for finite measure spaces
Case 2: $\mu(P)>0$.

Proof of The Radon-Nikodym Theorem for finite measure spaces
Case 2: $\mu(P)>0$. Note that

$$
g_{0}:=f_{0}+\epsilon l_{P} \in \mathcal{F}
$$

## Proof of The Radon-Nikodym Theorem for finite measure

 spacesCase 2: $\mu(P)>0$. Note that

$$
g_{0}:=f_{0}+\epsilon l_{P} \in \mathcal{F}
$$

since for all $A \in \mathcal{M}$

## Proof of The Radon-Nikodym Theorem for finite measure

 spacesCase 2: $\mu(P)>0$. Note that

$$
g_{0}:=f_{0}+\epsilon l_{P} \in \mathcal{F}
$$

since for all $A \in \mathcal{M}$
$\int_{A}\left(f_{0}+\epsilon I_{P}\right) d \mu(x)=\int_{A} f_{0} d \mu(x)+\epsilon \mu(P \cap A) \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(P \cap A)$

## Proof of The Radon-Nikodym Theorem for finite measure

 spacesCase 2: $\mu(P)>0$. Note that

$$
g_{0}:=f_{0}+\epsilon l_{P} \in \mathcal{F}
$$

since for all $A \in \mathcal{M}$

$$
\begin{aligned}
\int_{A}\left(f_{0}+\epsilon I_{P}\right) d \mu(x)= & \int_{A} f_{0} d \mu(x)+\epsilon \mu(P \cap A) \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(P \cap A) \\
& \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(A)=\nu(A)
\end{aligned}
$$

## Proof of The Radon-Nikodym Theorem for finite measure

 spacesCase 2: $\mu(P)>0$. Note that

$$
g_{0}:=f_{0}+\epsilon l_{P} \in \mathcal{F}
$$

since for all $A \in \mathcal{M}$

$$
\begin{aligned}
\int_{A}\left(f_{0}+\epsilon I_{P}\right) d \mu(x)= & \int_{A} f_{0} d \mu(x)+\epsilon \mu(P \cap A) \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(P \cap A) \\
& \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(A)=\nu(A)
\end{aligned}
$$

Next, since $\mu(P)>0$, we have that

$$
\int g_{0} d \mu(x)=m+\epsilon \mu(P)>m
$$

contradicting the definition of $m$.

## Proof of The Radon-Nikodym Theorem for finite measure

 spacesCase 2: $\mu(P)>0$. Note that

$$
g_{0}:=f_{0}+\epsilon l_{P} \in \mathcal{F}
$$

since for all $A \in \mathcal{M}$

$$
\begin{aligned}
\int_{A}\left(f_{0}+\epsilon I_{P}\right) d \mu(x)= & \int_{A} f_{0} d \mu(x)+\epsilon \mu(P \cap A) \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(P \cap A) \\
& \leq \int_{A} f_{0} d \mu(x)+\nu_{0}(A)=\nu(A)
\end{aligned}
$$

Next, since $\mu(P)>0$, we have that

$$
\int g_{0} d \mu(x)=m+\epsilon \mu(P)>m
$$

contradicting the definition of $m$. Contradiction. QED

## Proof of uniqueness in The Radon-Nikodym Theorem for finite measure spaces

For uniqueness, one notes that if $\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}>0$,

## Proof of uniqueness in The Radon-Nikodym Theorem for finite measure spaces

For uniqueness, one notes that if $\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}>0$, then WLOG $\mu\left\{x: f_{0}(x)>g_{0}(x)\right\}>0$

## Proof of uniqueness in The Radon-Nikodym Theorem for finite measure spaces

For uniqueness, one notes that if $\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}>0$, then WLOG $\mu\left\{x: f_{0}(x)>g_{0}(x)\right\}>0$ which yields

## Proof of uniqueness in The Radon-Nikodym Theorem for finite measure spaces

For uniqueness, one notes that if $\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}>0$, then WLOG $\mu\left\{x: f_{0}(x)>g_{0}(x)\right\}>0$ which yields

$$
\int_{\left\{x: f_{0}(x)>g_{0}(x)\right\}} f_{0}(x) d \mu(x)>\int_{\left\{x: f_{0}(x)>g_{0}(x)\right\}} g_{0}(x) d \mu(x)
$$

## Proof of uniqueness in The Radon-Nikodym Theorem for finite measure spaces

For uniqueness, one notes that if $\mu\left\{x: f_{0}(x) \neq g_{0}(x)\right\}>0$, then WLOG $\mu\left\{x: f_{0}(x)>g_{0}(x)\right\}>0$ which yields

$$
\int_{\left\{x: f_{0}(x)>g_{0}(x)\right\}} f_{0}(x) d \mu(x)>\int_{\left\{x: f_{0}(x)>g_{0}(x)\right\}} g_{0}(x) d \mu(x)
$$

contradicting the fact that each integral equals $\nu\left\{x: f_{0}(x)>g_{0}(x)\right\}$.

The Lebesgue Decomposition Theorem

Recall

$$
\begin{aligned}
& \text { (1) } \mathcal{F}:=\left\{f: X \rightarrow[0, \infty): \int_{A} f(x) d \mu(x) \leq \nu(A) \forall A \in \mathcal{M}\right\} . \\
& \text { (2) } m:=\sup \left\{\int f(x) d \mu(x): f \in \mathcal{F}\right\} .
\end{aligned}
$$

(3) There exists $f_{0} \in \mathcal{F}$ for which $\int f_{0}(x) d \mu(x)=m$.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Recall

$$
\begin{aligned}
& \text { (1) } \mathcal{F}:=\left\{f: X \rightarrow[0, \infty): \int_{A} f(x) d \mu(x) \leq \nu(A) \forall A \in \mathcal{M}\right\} . \\
& \text { (2) } m:=\sup \left\{\int f(x) d \mu(x): f \in \mathcal{F}\right\} .
\end{aligned}
$$

(3) There exists $f_{0} \in \mathcal{F}$ for which $\int f_{0}(x) d \mu(x)=m$.

$$
\text { (4) } \nu_{0}:=\nu-f_{0} \mu \text {, }
$$

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Recall

$$
\begin{aligned}
& \text { (1) } \mathcal{F}:=\left\{f: X \rightarrow[0, \infty): \int_{A} f(x) d \mu(x) \leq \nu(A) \forall A \in \mathcal{M}\right\} . \\
& \text { (2) } m:=\sup \left\{\int f(x) d \mu(x): f \in \mathcal{F}\right\} .
\end{aligned}
$$

(3) There exists $f_{0} \in \mathcal{F}$ for which $\int f_{0}(x) d \mu(x)=m$.

$$
\text { (4) } \nu_{0}:=\nu-f_{0} \mu \text {, }
$$

For the RNT, we had shown that $\nu_{0}=0$ when we had assumed that $\nu \ll \mu$.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Recall

$$
\begin{aligned}
& \text { (1) } \mathcal{F}:=\left\{f: X \rightarrow[0, \infty): \int_{A} f(x) d \mu(x) \leq \nu(A) \forall A \in \mathcal{M}\right\} . \\
& \text { (2) } m:=\sup \left\{\int f(x) d \mu(x): f \in \mathcal{F}\right\} .
\end{aligned}
$$

(3) There exists $f_{0} \in \mathcal{F}$ for which $\int f_{0}(x) d \mu(x)=m$.

$$
\text { (4) } \nu_{0}:=\nu-f_{0} \mu \text {, }
$$

For the RNT, we had shown that $\nu_{0}=0$ when we had assumed that $\nu \ll \mu$. Now we will show that $\nu_{0} \perp \mu$

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Recall

$$
\begin{aligned}
& \text { (1) } \mathcal{F}:=\left\{f: X \rightarrow[0, \infty): \int_{A} f(x) d \mu(x) \leq \nu(A) \forall A \in \mathcal{M}\right\} . \\
& \text { (2) } m:=\sup \left\{\int f(x) d \mu(x): f \in \mathcal{F}\right\} .
\end{aligned}
$$

(3) There exists $f_{0} \in \mathcal{F}$ for which $\int f_{0}(x) d \mu(x)=m$.

$$
\text { (4) } \nu_{0}:=\nu-f_{0} \mu \text {, }
$$

For the RNT, we had shown that $\nu_{0}=0$ when we had assumed that $\nu \ll \mu$. Now we will show that $\nu_{0} \perp \mu$ completing the proof with $\nu_{a c}:=f_{0} \mu$ and $\nu_{s}:=\nu_{0}$.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Let $\left(\epsilon_{n}\right)$ be a decreasing sequence of numbers in $(0,1)$ converging to 0 . Let $\left(P_{n}, N_{n}\right)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon_{n} \mu$.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Let $\left(\epsilon_{n}\right)$ be a decreasing sequence of numbers in $(0,1)$ converging to 0 . Let $\left(P_{n}, N_{n}\right)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon_{n} \mu$. Case 1: There exists $n$ with $\mu\left(P_{n}\right)>0$.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Let $\left(\epsilon_{n}\right)$ be a decreasing sequence of numbers in $(0,1)$ converging to 0 . Let $\left(P_{n}, N_{n}\right)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon_{n} \mu$. Case 1: There exists $n$ with $\mu\left(P_{n}\right)>0$. This leads to a contradiction exactly as in case 2 in the RNT.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Let $\left(\epsilon_{n}\right)$ be a decreasing sequence of numbers in $(0,1)$ converging to 0 . Let $\left(P_{n}, N_{n}\right)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon_{n} \mu$. Case 1: There exists $n$ with $\mu\left(P_{n}\right)>0$. This leads to a contradiction exactly as in case 2 in the RNT. Do only a review.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Let $\left(\epsilon_{n}\right)$ be a decreasing sequence of numbers in $(0,1)$ converging to 0 . Let $\left(P_{n}, N_{n}\right)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon_{n} \mu$.

Case 1: There exists $n$ with $\mu\left(P_{n}\right)>0$. This leads to a contradiction exactly as in case 2 in the RNT. Do only a review.

One shows that $g_{0}:=f_{0}+\epsilon_{n} I_{P_{n}} \in \mathcal{F}$

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Let $\left(\epsilon_{n}\right)$ be a decreasing sequence of numbers in $(0,1)$ converging to 0 . Let $\left(P_{n}, N_{n}\right)$ be a Hahn decomposition for the signed measure $\nu_{0}-\epsilon_{n} \mu$.

Case 1: There exists $n$ with $\mu\left(P_{n}\right)>0$. This leads to a contradiction exactly as in case 2 in the RNT. Do only a review.

One shows that $g_{0}:=f_{0}+\epsilon_{n} I_{P_{n}} \in \mathcal{F}$ and $\int g_{0} d \mu(x)=m+\epsilon_{n} \mu\left(P_{n}\right)>m$, a contradiction.

## The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)
Case 2:

$$
\mu\left(P_{n}\right)=0 \text { for each } n
$$

The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)
Case 2:

$$
\mu\left(P_{n}\right)=0 \text { for each } n
$$

Let $P:=\bigcup_{n} P_{n}$ and $N:=\bigcap_{n} N_{n}$.

The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Case 2:

$$
\mu\left(P_{n}\right)=0 \text { for each } n
$$

Let $P:=\bigcup_{n} P_{n}$ and $N:=\bigcap_{n} N_{n}$.

- $(P, N)$ is a partition since

$$
P^{c}=\left(\bigcup_{n} P_{n}\right)^{c}=\bigcap_{n} P_{n}^{c}=\bigcap_{n} N_{n}=N
$$

The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Case 2:

$$
\mu\left(P_{n}\right)=0 \text { for each } n
$$

Let $P:=\bigcup_{n} P_{n}$ and $N:=\bigcap_{n} N_{n}$.

- $(P, N)$ is a partition since

$$
P^{c}=\left(\bigcup_{n} P_{n}\right)^{c}=\bigcap_{n} P_{n}^{c}=\bigcap_{n} N_{n}=N
$$

- $\mu(P)=0$.

The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Case 2:

$$
\mu\left(P_{n}\right)=0 \text { for each } n
$$

Let $P:=\bigcup_{n} P_{n}$ and $N:=\bigcap_{n} N_{n}$.

- $(P, N)$ is a partition since

$$
P^{c}=\left(\bigcup_{n} P_{n}\right)^{c}=\bigcap_{n} P_{n}^{c}=\bigcap_{n} N_{n}=N
$$

- $\mu(P)=0$.
- Also, for each $n$, we have

$$
\nu_{0}(N) \leq \nu_{0}\left(N_{n}\right) \leq \epsilon_{n} \mu\left(N_{n}\right) \leq \epsilon_{n} \mu(X)
$$

This gives $\nu_{0}(N)=0$

The proof of the Lebesgue Decomposition Theorem (uses the proof of the Radon-Nikodym Theorem)

Case 2:

$$
\mu\left(P_{n}\right)=0 \text { for each } n
$$

Let $P:=\bigcup_{n} P_{n}$ and $N:=\bigcap_{n} N_{n}$.

- $(P, N)$ is a partition since

$$
P^{c}=\left(\bigcup_{n} P_{n}\right)^{c}=\bigcap_{n} P_{n}^{c}=\bigcap_{n} N_{n}=N
$$

- $\mu(P)=0$.
- Also, for each $n$, we have

$$
\nu_{0}(N) \leq \nu_{0}\left(N_{n}\right) \leq \epsilon_{n} \mu\left(N_{n}\right) \leq \epsilon_{n} \mu(X)
$$

This gives $\nu_{0}(N)=0$ and so $\nu_{0} \perp \mu$.
QED

## Another simpler decomposition

Given any $\sigma$-finite measure space $(X, \mathcal{M}, \mu)$ with single points being measurable (which is basically always the case),

## Another simpler decomposition

Given any $\sigma$-finite measure space $(X, \mathcal{M}, \mu)$ with single points being measurable (which is basically always the case), we can always decompose $\mu$ into an atomic piece and a continuous piece as follows.

## Another simpler decomposition

Given any $\sigma$-finite measure space $(X, \mathcal{M}, \mu)$ with single points being measurable (which is basically always the case), we can always decompose $\mu$ into an atomic piece and a continuous piece as follows. If $\mathcal{A}$ is the set of atoms, we can write

$$
\mu=\left.\mu\right|_{\mathcal{A}}+\left.\mu\right|_{\mathcal{A}^{c}} .
$$

## Another simpler decomposition

Given any $\sigma$-finite measure space $(X, \mathcal{M}, \mu)$ with single points being measurable (which is basically always the case), we can always decompose $\mu$ into an atomic piece and a continuous piece as follows. If $\mathcal{A}$ is the set of atoms, we can write

$$
\mu=\left.\mu\right|_{\mathcal{A}}+\left.\mu\right|_{\mathcal{A}^{c}}
$$

Then $\left.\mu\right|_{\mathcal{A}}$ is atomic, $\left.\mu\right|_{\mathcal{A}^{c}}$ is continuous and these measures are mutually singular.

## Full decomposition on $(R, \mathcal{B})$

Theorem
Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$.

## Full decomposition on $(R, \mathcal{B})$

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

## Full decomposition on $(R, \mathcal{B})$

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

$$
\mu=\mu_{d}+\mu_{\mathrm{sc}}+\mu_{\mathrm{ac}}
$$

## Full decomposition on $(R, \mathcal{B})$

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

$$
\mu=\mu_{d}+\mu_{s c}+\mu_{a c}
$$

where $\mu_{d}$ is an atomic measure ("d" for discrete),

## Full decomposition on $(R, \mathcal{B})$

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

$$
\mu=\mu_{d}+\mu_{\mathrm{sc}}+\mu_{\mathrm{ac}}
$$

where $\mu_{d}$ is an atomic measure ("d" for discrete), $\mu_{s c}$ is a continuous measure which is mutually singular with respect to Lebesgue measure

## Full decomposition on $(R, \mathcal{B})$

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

$$
\mu=\mu_{d}+\mu_{\mathrm{sc}}+\mu_{\mathrm{ac}}
$$

where $\mu_{d}$ is an atomic measure ("d" for discrete), $\mu_{s c}$ is a continuous measure which is mutually singular with respect to Lebesgue measure and $\mu_{\mathrm{ac}}$ is absolutely continuous with respect to Lebesgue measure.

## Full decomposition on $(R, \mathcal{B})$

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

$$
\mu=\mu_{d}+\mu_{\mathrm{sc}}+\mu_{\mathrm{ac}}
$$

where $\mu_{d}$ is an atomic measure ("d" for discrete), $\mu_{s c}$ is a continuous measure which is mutually singular with respect to Lebesgue measure and $\mu_{\mathrm{ac}}$ is absolutely continuous with respect to Lebesgue measure. Also, the three measures are mutually singular.

## Full decomposition on ( $R, \mathcal{B}$ )

## Theorem

Let $\mu$ be a $\sigma$-finite measure on $(R, \mathcal{B})$. Then $\mu$ can be decomposed uniquely as

$$
\mu=\mu_{d}+\mu_{s c}+\mu_{\mathrm{ac}}
$$

where $\mu_{d}$ is an atomic measure ("d" for discrete), $\mu_{s c}$ is a continuous measure which is mutually singular with respect to Lebesgue measure and $\mu_{\mathrm{ac}}$ is absolutely continuous with respect to Lebesgue measure. Also, the three measures are mutually singular.

The exact same theorem and proof works in $R^{n}$ with $n$-dimensional Lebesgue measure.

## Full decomposition on $(R, \mathcal{B})$

- If $X$ is a random variable with for example either a normal or exponential distribution, its law would only have the third piece in the above decomposition.

## Full decomposition on $(R, \mathcal{B})$

- If $X$ is a random variable with for example either a normal or exponential distribution, its law would only have the third piece in the above decomposition.
- If $X$ is a random variable with for example a Poisson or geometric distribution, its law would only have the first piece in the above decomposition.

## Full decomposition on $(R, \mathcal{B})$

- If $X$ is a random variable with for example either a normal or exponential distribution, its law would only have the third piece in the above decomposition.
- If $X$ is a random variable with for example a Poisson or geometric distribution, its law would only have the first piece in the above decomposition.
- The existence of a random variable which contains the second piece is quite surprising to people studying probability.

## Full decomposition on $(R, \mathcal{B})$

- If $X$ is a random variable with for example either a normal or exponential distribution, its law would only have the third piece in the above decomposition.
- If $X$ is a random variable with for example a Poisson or geometric distribution, its law would only have the first piece in the above decomposition.
- The existence of a random variable which contains the second piece is quite surprising to people studying probability. If the law of $X$ would only have the second piece in its decomposition,

## Full decomposition on $(R, \mathcal{B})$

- If $X$ is a random variable with for example either a normal or exponential distribution, its law would only have the third piece in the above decomposition.
- If $X$ is a random variable with for example a Poisson or geometric distribution, its law would only have the first piece in the above decomposition.
- The existence of a random variable which contains the second piece is quite surprising to people studying probability. If the law of $X$ would only have the second piece in its decomposition, it would mean that $X$ has no point masses

## Full decomposition on $(R, \mathcal{B})$

- If $X$ is a random variable with for example either a normal or exponential distribution, its law would only have the third piece in the above decomposition.
- If $X$ is a random variable with for example a Poisson or geometric distribution, its law would only have the first piece in the above decomposition.
- The existence of a random variable which contains the second piece is quite surprising to people studying probability. If the law of $X$ would only have the second piece in its decomposition, it would mean that $X$ has no point masses but nonetheless there does not exist a probability density function.

## Proof of the Full decomposition on $(R, \mathcal{B})$

## Proof:

We first decompose $\mu$ into an atomic piece $\mu_{d}$ and a continuous measure $\mu_{c}$.

$$
\mu=\mu_{d}+\mu_{c} .
$$

## Proof of the Full decomposition on $(R, \mathcal{B})$

Proof:
We first decompose $\mu$ into an atomic piece $\mu_{\boldsymbol{d}}$ and a continuous measure $\mu_{c}$.

$$
\mu=\mu_{d}+\mu_{c} .
$$

We now apply the Lebesgue Decomposition Theorem to write

$$
\mu_{c}=\mu_{\mathrm{sc}}+\mu_{\mathrm{ac}}
$$

## Proof of the Full decomposition on $(R, \mathcal{B})$

Proof:
We first decompose $\mu$ into an atomic piece $\mu_{\boldsymbol{d}}$ and a continuous measure $\mu_{c}$.

$$
\mu=\mu_{d}+\mu_{c} .
$$

We now apply the Lebesgue Decomposition Theorem to write

$$
\mu_{c}=\mu_{s c}+\mu_{a c}
$$

where $\mu_{s c} \perp m$ and $\mu_{a c} \ll m$. Now combine. QED

## Proof of the Full decomposition on $(R, \mathcal{B})$

Proof:
We first decompose $\mu$ into an atomic piece $\mu_{\boldsymbol{d}}$ and a continuous measure $\mu_{c}$.

$$
\mu=\mu_{d}+\mu_{c} .
$$

We now apply the Lebesgue Decomposition Theorem to write

$$
\mu_{c}=\mu_{s c}+\mu_{a c}
$$

where $\mu_{s c} \perp m$ and $\mu_{a c} \ll m$. Now combine. QED

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite.

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that
$\mu(A)<\delta$ implies that $\nu(A)<\epsilon$.

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that
$\mu(A)<\delta$ implies that $\nu(A)<\epsilon$.
In particular, if $f \in L^{+, 1}(X, \mathcal{M}, \mu)$, then for every $\epsilon>0$, there exists $\delta>0$

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that
$\mu(A)<\delta$ implies that $\nu(A)<\epsilon$.
In particular, if $f \in L^{+, 1}(X, \mathcal{M}, \mu)$, then for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \int_{A} f d \mu<\epsilon
$$

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \nu(A)<\epsilon .
$$

In particular, if $f \in L^{+, 1}(X, \mathcal{M}, \mu)$, then for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \int_{A} f d \mu<\epsilon
$$

Proof:

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \nu(A)<\epsilon .

\mu(A)<\delta \text { implies that } \int_{A} f d \mu<\epsilon .
$$

Proof:
The "if" direction is essentially immediate (and does not require that $\nu$ be finite).
If $\mu(A)=0$, then $\mu(A)<\delta$ for every $\delta>0$

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \nu(A)<\epsilon .
$$

In particular, if $f \in L^{+, 1}(X, \mathcal{M}, \mu)$, then for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \int_{A} f d \mu<\epsilon
$$

Proof:
The "if" direction is essentially immediate (and does not require that $\nu$ be finite).
If $\mu(A)=0$, then $\mu(A)<\delta$ for every $\delta>0$ and hence $\nu(A)<\epsilon$ for every $\epsilon>0$.

## Alternative description of absolute continuity

Proposition: Let $\mu$ and $\nu$ be measures with $\nu$ finite. Then $\nu \ll \mu$ if and only if for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \nu(A)<\epsilon .
$$

In particular, if $f \in L^{+, 1}(X, \mathcal{M}, \mu)$, then for every $\epsilon>0$, there exists $\delta>0$ so that

$$
\mu(A)<\delta \text { implies that } \int_{A} f d \mu<\epsilon .
$$

Proof:
The "if" direction is essentially immediate (and does not require that $\nu$ be finite).
If $\mu(A)=0$, then $\mu(A)<\delta$ for every $\delta>0$ and hence $\nu(A)<\epsilon$ for every $\epsilon>0$. So $\nu(A)=0$.

## Alternative description of absolute continuity

If the statement on the RHS fails, then there would exist an $\epsilon_{0}>0$ and sets $\left(A_{n}\right)$ with $\mu\left(A_{n}\right) \leq 1 / 2^{n}$ and $\nu\left(A_{n}\right) \geq \epsilon_{0}$.

## Alternative description of absolute continuity

If the statement on the RHS fails, then there would exist an $\epsilon_{0}>0$ and sets $\left(A_{n}\right)$ with $\mu\left(A_{n}\right) \leq 1 / 2^{n}$ and $\nu\left(A_{n}\right) \geq \epsilon_{0}$.

Let $A:=\lim \sup A_{n}$. The Borel Cantelli Lemma tells us that $\mu(A)=0$.

## Alternative description of absolute continuity

If the statement on the RHS fails, then there would exist an $\epsilon_{0}>0$ and sets $\left(A_{n}\right)$ with $\mu\left(A_{n}\right) \leq 1 / 2^{n}$ and $\nu\left(A_{n}\right) \geq \epsilon_{0}$.

Let $A:=\lim \sup A_{n}$. The Borel Cantelli Lemma tells us that $\mu(A)=0$.
We will show that $\nu(A) \geq \epsilon_{0}$ which contradicts $\nu \ll \mu$.

## Alternative description of absolute continuity

If the statement on the RHS fails, then there would exist an $\epsilon_{0}>0$ and sets $\left(A_{n}\right)$ with $\mu\left(A_{n}\right) \leq 1 / 2^{n}$ and $\nu\left(A_{n}\right) \geq \epsilon_{0}$.

Let $A:=\lim \sup A_{n}$. The Borel Cantelli Lemma tells us that $\mu(A)=0$.
We will show that $\nu(A) \geq \epsilon_{0}$ which contradicts $\nu \ll \mu$.
For each $n$,

$$
\nu\left(\bigcup_{k=n}^{\infty} A_{k}\right) \geq \epsilon_{0} .
$$

## Alternative description of absolute continuity

If the statement on the RHS fails, then there would exist an $\epsilon_{0}>0$ and sets $\left(A_{n}\right)$ with $\mu\left(A_{n}\right) \leq 1 / 2^{n}$ and $\nu\left(A_{n}\right) \geq \epsilon_{0}$.

Let $A:=\lim \sup A_{n}$. The Borel Cantelli Lemma tells us that $\mu(A)=0$.
We will show that $\nu(A) \geq \epsilon_{0}$ which contradicts $\nu \ll \mu$.
For each $n$,

$$
\nu\left(\bigcup_{k=n}^{\infty} A_{k}\right) \geq \epsilon_{0}
$$

Now $n \rightarrow \infty$ using continuity from above for $\nu$ ( $\nu$ is a finite measure) gives $\nu(A) \geq \epsilon_{0}$.
QED
